# Myelodysplastic Syndrome: Molecular Markers & Management with Novel Drugs

## Molecular Markers in MDS

**Joo Song, MD**

Interim Vice Chair, Department of Pathology

Chief, Division of Hematopathology

Clinical Professor

City of Hope

# Disclosures

- I do not have any relevant financial relationships.

*This presentation and/or comments will provide a balanced, non-promotional, and evidence-based approach to all diagnostic, therapeutic and/or research related content.*

# Cultural Linguistic Competency (CLC) & Implicit Bias (IB)

## STATE LAW:

The California legislature has passed Assembly Bill (AB) 1195, which states that as of July 1, 2006, all Category 1 CME activities that relate to patient care must include a cultural diversity/linguistics component. It has also passed AB 241, which states that as of January 1, 2022, all continuing education courses for a physician and surgeon **must** contain curriculum that includes specified instruction in the understanding of implicit bias in medical treatment.

*The cultural and linguistic competency (CLC) and implicit bias (IB) definitions reiterate how patients' diverse backgrounds may impact their access to care.*

## **EXEMPTION:**

Business and Professions Code 2190.1 exempts activities which are dedicated solely to research or other issues that do not contain a direct patient care component.

***This presentation is dedicated solely to research or other issues that do not contain a direct patient care component.***

# Overview of MDS

- Ineffective hematopoiesis
- Peripheral blood
- Bone marrow biopsy

# Testing and Prognosis

- Importance of prognostic markers
  - IPSS, IPSS-R, IPSS-M
- Karyotype and FISH analysis
- NGS panel
  - Whole genome sequencing
  - Target sequencing platform

# Testing

- Types of samples
  - Bone marrow aspirate or clot sections
    - Limitations: Aparticulate clot
  - Peripheral blood
    - Limitations: Low WBC count

# Cytogenetics and FISH

- **Karyotype**
- **FISH analysis**
- **Very Good: -Y, del(11q)**
- **Good: del(5q), 20q deletions**
- **Intermediate: +8, del(12p), +19**
- **Poor: monosomy 7, inv(3)**
- **Very Poor: Complex karyotype (>3)**

	Prognostic score value						
	0	0.5	1	1.5	2	3	4
<b>Prognostic category</b>	Very good		Good		Intermediate	Poor	Very poor
Cytogenetics							
BM blasts, %	≤ 2		> 2 to < 5		5-10	> 10	
Hgb, g/dL	≥ 10		8 to < 10		< 8		
Platelets, x 10 <sup>9</sup> /L	≥ 100		50 to < 100		< 50		
ANC, x 10 <sup>9</sup> /L	≥ 0.8		< 0.8				
<b>Cytogenetic group</b>	<b>Characteristics</b>						
Very good	-Y, del(11q)						
Good	Normal, del(5q), del(12p), del(20q), del(5q) + 1 additional abnormality						
Intermediate	del(7q), +8, +19, i(17q), other abnormalities not in other groups						
Poor	-7, inv(3)/t(3q), -7/del(7q) + 1 additional abnormality, complex (3 abnormalities)						
Very poor	Complex (> 3 abnormalities)						

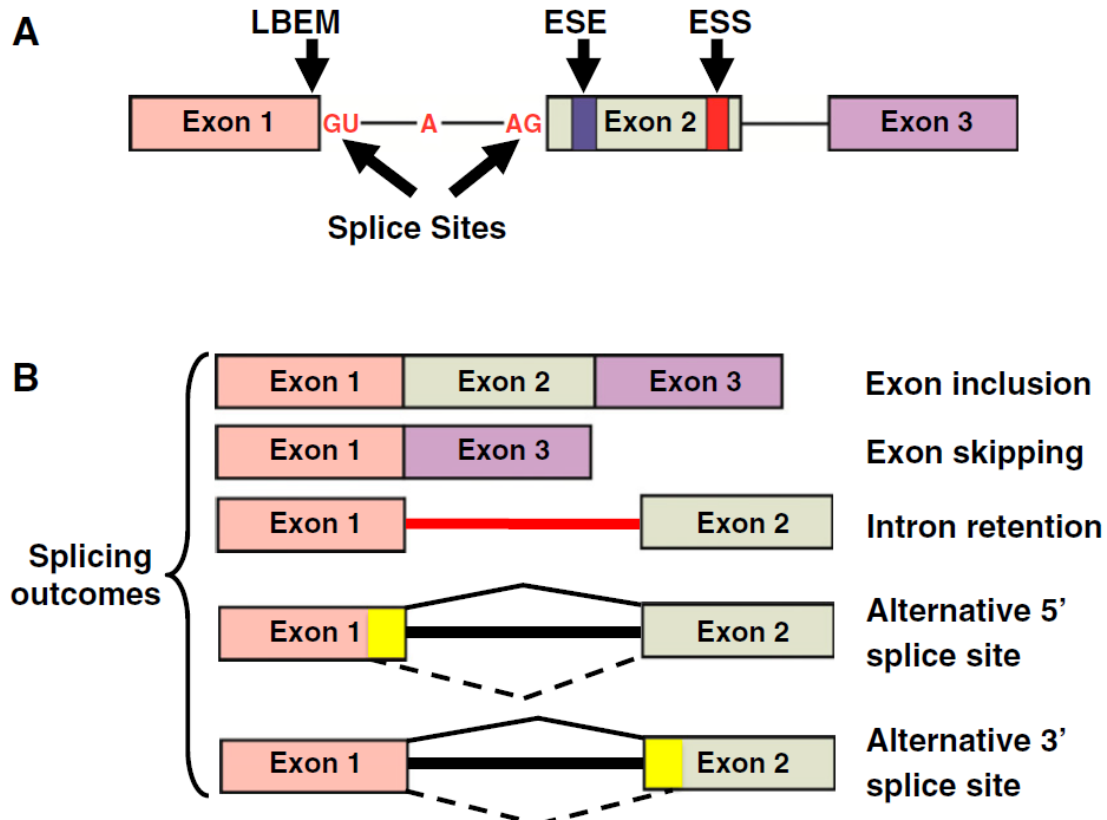

# NGS

- Splicing factor mutations: SF3B1, SRSF2, U2AF1, ZRSR2
- DNA methylation: TET2, DNMT3A, IDH1/IDH2, KMT2A/MLL
- Chromatin modification: ASXL1, EZH2
- Tumor suppressor: TP53
- Signaling pathway: STAG2, JAK2, NRAS/KRAS, FLT3

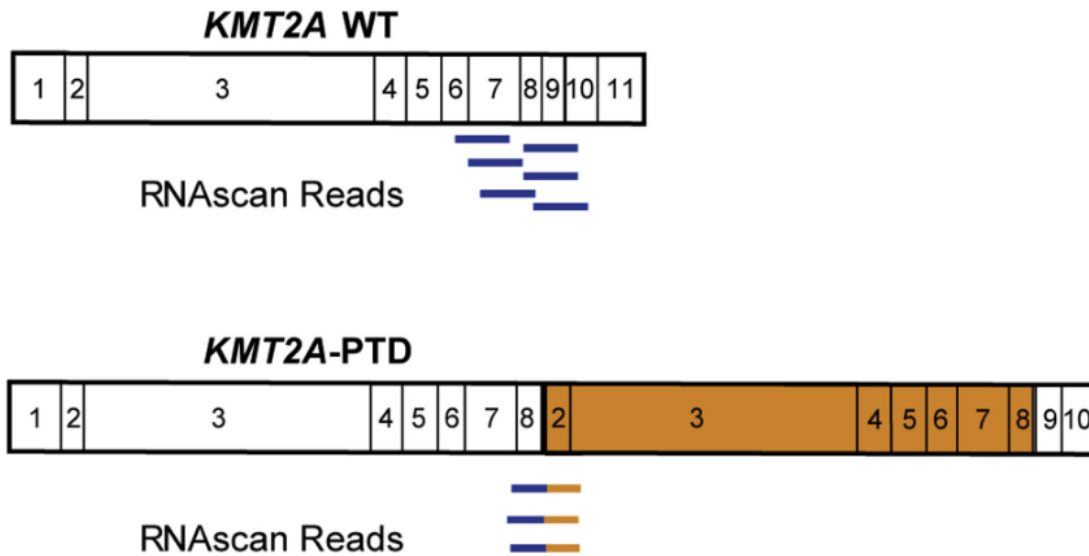

# NGS

- Splicing factor mutations: SF3B1, SRSF2, U2AF1, ZRSR2

# NGS

- DNA methylation: TET2, DNMT3A, IDH1/IDH2
- **Histone: KMT2A (Partial Tandem Duplication)**

## NGS

## • TP53

- DNA repair
- Apoptosis
- Senescence
- Angiogenesis
- Oxidative stress

## • Multi-hit TP53

- Biallelic
- LOH

# IPSS-M

- Incorporates IPSS-R and genomics
- 2957 patients, validated 754 patients
- 31 genes
- **Adverse**
  - **TP53 (multi-hit)**
  - **MLL/KMT2A PTD**
  - **FLT3 ITD/TKD**
  - **SF3B1 and 5q-**
- **Favorable**
  - **SF3B1 isolated**

Bernard et al, NEJM Evidence, 2022

Table 1. IPSS-M Risk Score Construction from an Adjusted Cox Multivariable Regression for Leukemia-Free Survival.\*

Category and Variable	Adjusted Hazard Ratio (95% CI)†
Clinical	
Bone marrow blasts — %	1.07 (1.05–1.09)
min(Platelets,250) — $\times 10^9/l$	0.998 (0.997–0.999)
Hemoglobin — g/dl	0.84 (0.81–0.88)
Cytogenetic	
IPSS-R cytogenetic category§	1.33 (1.21–1.47)
Gene main effects (17 variables, 16 genes)¶	
<i>TP53</i> <sup>multihit</sup>	3.27 (2.38–4.48)
<i>MLL</i> <sup>PTD</sup>	2.22 (1.49–3.32)
<i>FLT3</i> <sup>ITD+TKD</sup>	2.22 (1.11–4.45)
<i>SF3B1</i> <sup>5q</sup>	1.66 (1.03–2.66)
<i>NPM1</i>	1.54 (0.78–3.02)
<i>RUNX1</i>	1.53 (1.23–1.89)
<i>NRAS</i>	1.52 (1.05–2.20)
<i>ETV6</i>	1.48 (0.98–2.23)
<i>IDH2</i>	1.46 (1.05–2.02)
<i>CBL</i>	1.34 (0.99–1.82)
<i>EZH2</i>	1.31 (0.98–1.75)
<i>U2AF1</i>	1.28 (1.01–1.61)
<i>SRSF2</i>	1.27 (1.03–1.56)
<i>DNMT3A</i>	1.25 (1.02–1.53)
<i>ASXL1</i>	1.24 (1.02–1.51)
<i>KRAS</i>	1.22 (0.84–1.77)
<i>SF3B1</i> <sup>α</sup>	0.92 (0.74–1.16)
Gene residuals (1 variable, 15 genes; possible values of 0, 1, or 2)	
min(Nres,2)	1.26 (1.12–1.42)

## IPSS-M

- Improved prognostic determination compared to IPSS-R
- 46% re-stratified
- **Real-World validation** (Sauta et al)
- Open access calculator

Bernard et al, NEJM evidence, 2022  
Sauta et al, JCO 2023

## Summary

- IPSS-R still important and relevant for prognostication
- Genomics has an important role (e.g. TP53, MLL, FLT3, SF3B1)
- Molecular is more routinely used
- Improves prognostic accuracy
- Tailored therapeutic decisions
